

LINBING ZHANG

AI DATA OPERATIONS

Phone: 185 **** 6353
Email: linfu7530@gmail.com
Target role: AI Data Operations

PROFILE

AI data operations professional with end-to-end experience across requirement intake, scenario decomposition, taxonomy design, rule documentation, pilot annotation, production annotation, QA review, bad-case analysis, and data delivery. Experienced with text dialogue, AI voice-call evaluation, image annotation, and video/frame-level computer-vision programs.

CORE STRENGTHS

PROGRAM DELIVERY Translate business questions into trainable data rules and operating workflows.	MULTIMODAL EXPERIENCE Text, voice, image, and video projects across AI support, model evaluation, and in-cabin DMS.
QUALITY & BAD CASES Sampling, review, adjudication, error taxonomy, root-cause analysis, and rule iteration.	TEAM & TOOL ENABLEMENT Task allocation, standards training, progress review, and workflow acceleration with Coze, Python, Cursor, and Codex.

EXPERIENCE

People's Insurance Company of China (PICC)

2017.07 - 2026.04

AI Data Operations / Auto-Insurance Domain

In-Cabin DMS Driver-State Recognition

Program context: Computer-vision data for detecting fatigue, distraction, phone use, smoking, downward phone gaze, and other driver-risk behaviors.

- Coordinated 7 annotators and 3 QA reviewers, setting task allocation, capacity goals, progress tracking, and quality reviews for 420K image and frame-level data items.
- Aligned the team on labels for normal driving, closed-eye fatigue, phone gaze, calling, smoking, gaze deviation, hands-off-wheel behavior, occlusion, and uncertainty.
- Established an annotation-sampling-review-adjudication workflow for mislabels, misses, and disputed samples.
- Analyzed recurring hard cases such as face-touching vs phone calls, instrument-panel gaze vs phone gaze, and drinking vs smoking; added negative examples and clearer boundary rules.
- Recorded an initial overall accuracy baseline of approximately 85%, with a post-refinement target above 90%; priority recall targets for high-risk behaviors were approximately 85-90%.

SELECTED AI DATA PROGRAMS

AI Voice Calls: Three-Model Benchmark

Program context: Side-by-side evaluation of Doubao, ERNIE Bot, and iFlytek Spark using the same consumer voice-call samples to support model selection for an in-vehicle voice assistant.

- Led evaluation design, defining model scope, routine and complex scenario tiers, scoring dimensions, and composite-score logic.
- Coordinated 4 evaluators using transcribed prompts and model responses under a unified rubric covering comprehension, correctness, experience, and safety boundaries.
- Classified low-scoring cases including generic responses, lost context, missed negation, omitted constraints, and weak sensitive-topic handling.
- Produced the evaluation guide, dimension-level scoring, composite ranking, root-cause categories, and optimization recommendations.
- Evaluation finding: Doubao was the most stable overall; ERNIE Bot was weaker in response usefulness; iFlytek Spark was less stable in complex recognition and response scenarios.

Auto-Insurance AI Support: Intent Classification

Program context: Intent recognition for policy lookup, purchase, renewal, product, fee, service-process, human-handoff, and complaint scenarios.

- Led rule documentation and taxonomy design across core intent, business type, issue category, key information, risk level, human escalation, answer source, and standard response.
- Clarified confusing boundaries including renewal vs product inquiry, policy lookup vs purchase process, and routine support vs complaints or claims disputes.
- Ran a complete production loop from requirement intake and scenario decomposition through pilot annotation, production annotation, sampled QA, and bad-case capture.
- Used pilot disagreements and QA findings to add positive and negative examples, resolve boundary cases, and reduce repeated intent and knowledge-matching errors.
- Program targets: annotation QA pass rate above 95%, intent accuracy above 92%, knowledge/standard-answer matching above 90%, and escalation/rejection accuracy above 95%.

EDUCATION & TOOLS

EDUCATION	Bachelor's degree, Human Resource Management
CERTIFICATION	College English Test Band 4 (CET-4)
TOOLS	Coze, Python, Cursor, Codex, AI-assisted data and documentation workflows
MODALITIES	Text dialogue, voice-call evaluation, image annotation, video and frame-level data
